Abstract

A hydraulic operation controlling unit where the engine can be driven stably at a target output torque point and reduction in the work speed can be prevented at the time of light load, ~~and reduction in the cost for fuel can also be achieved, as well as a hydraulic excavator that is provided with the same, are provided.~~ includes an ~~An~~ engine control unit ~~23 controls~~ controlling the output of an engine ~~16~~, so that the output properties of the engine ~~16~~ become equi-horsepower properties or approximately equi-horsepower properties in a predetermined engine speed range ($N_2$ to $N_6$) ~~of the engine speed~~ that includes engine speed $N_3$, which corresponds to a matching point $M_3$~~, and a hydraulic pump absorbing torque~~ . A controlling unit ~~27~~ increases or reduces the absorbing torque of a hydraulic pump ~~17~~ in response to an increase or decrease in the engine speed, and thus, controls the absorbing torque of the hydraulic pump ~~17~~ so as to make the output torque $T_3$ of the engine~~,~~ ~~16~~ which corresponds to matching point $M_3$~~,~~ and the absorbing torque of the hydraulic pump ~~17~~ coincide with each other.
